# A First Course on Kinetics and Reaction Engineering Problem 1.3 

## Problem Purpose

This problem will help you determine whether you have mastered the learning objectives for this unit.

## Problem Statement

In the gasification of cellulosic biomass (here represented using its nominal formula, $\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}$ ), the carbon from the cellulose could be released either as CO , (See Practice Problem 1.1), or as $\mathrm{CO}_{2}$, reaction (1). In addition, the water-gas shift, reaction (2), can lead to a mixture of CO and $\mathrm{CO}_{2}$. Suppose a reaction began with 10 moles of $\mathrm{H}_{2} \mathrm{O}$ for every one mole of $\mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}$, and none of the products present. If half of the cellulose is consumed and the products contain 3 moles of $\mathrm{CO}_{2}$ for every mole of CO , what will the ratio of CO to $\mathrm{H}_{2}$ equal?

$$
\begin{align*}
& \mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{5}+7 \mathrm{H}_{2} \mathrm{O} \rightarrow 6 \mathrm{CO}_{2}+12 \mathrm{H}_{2}  \tag{1}\\
& \mathrm{CO}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{CO}_{2}+\mathrm{H}_{2} \tag{2}
\end{align*}
$$
