## Problem 5.1

## Problem Purpose

This problem will help you determine whether you have mastered the learning objectives for this unit.

## Problem Statement

Suppose that for a quick preliminary calculation you need an approximate value for the rate of reaction (1) below for a mixture containing $22 \% \mathrm{CO}, 46 \% \mathrm{H}_{2}, 1 \% \mathrm{CH}_{3} \mathrm{OH}$ and $31 \% \mathrm{CO}_{2}$ at a total pressure of 49.3 atm and a temperature of $327^{\circ} \mathrm{C}$. Suppose further, that you have obtained an old company report which says that the rate expression given in equation (2) below was shown to fit experimental data from reaction (1) at similar compositions and pressure, but at the temperatures given in the table below. Using the data in that table, what is your best estimate for the rate of reaction (1) at the conditions of interest to you. (Note: the rate expression used in this example is made-up and should not be used for any purpose other than answering this question.)

$$
\begin{align*}
& \mathrm{CO}+2 \mathrm{H}_{2} \rightleftarrows \mathrm{CH}_{3} \mathrm{OH}  \tag{1}\\
& r_{1}=k_{1} P_{C O}^{0.46} P_{H_{2}}^{1.37} \tag{2}
\end{align*}
$$

| Temperature <br> (degrees C) | $k$ <br> $\left(\mathrm{~mol} \mathrm{~min}^{-1} \mathrm{~L}^{-1} \mathrm{~atm}^{-1.83}\right)$ |
| :---: | :---: |
| 80 | 0.024 |
| 110 | 0.138 |
| 140 | 0.606 |
| 170 | 2.180 |
